Specification of the controlled designation of origin "MARGAUX"

approved by order of 31 March 2023, published in the JORF of 5 April 2023

CHAPTER I

I. – Name of the designation

Only wines meeting the specific provisions set out below may claim the controlled designation of origin "Margaux", initially recognised by the decree of 10 August 1954.

II. – Geographical denominations and complementary terms

No specific provision.

III. – Colour and types of product

The controlled designation of origin "Margaux" is reserved for still red wines.

IV. – Areas and zones in which the various operations are carried out

1° – Geographical area:

The harvesting of the grapes, the vinification, the elaboration and the ageing of the wines are carried out within the territory of the following communes of the Gironde department, on the basis of the official geographic code dated 1 January 2022: Arsac, Labarde, Margaux-Cantenac and Soussans.

2° – Delimited parcel area:

The wines come exclusively from vines situated within the delimited parcel production area as approved by the National Institute of Origin and Quality at the session of the competent national committee of 16 March 2007 and of 8 June 2016.

The National Institute of Origin and Quality lodges with the town halls of the communes referred to in 1° the graphic documents establishing the parcel boundaries of the production area thus approved.

3° – Immediate proximity area:

The immediate proximity area, defined by derogation for the vinification, the elaboration and the ageing, is made up of the territory of the following communes of the Gironde department: Arcins, Avensan, Lamarque, Ludon-Médoc, Macau and Le Pian-Médoc.

V. – Grape varieties

1° – Grape varieties:

The wines come from the following varieties:

- Main varieties: cabernet franc N, cabernet-sauvignon N, carmenère N, cot N (or malbec), merlot N and petit verdot N.

- Variety of interest for adaptation purposes: castets N, subject to the signature between the INAO, the ODG and the authorised operators concerned of an agreement conforming to the framework agreement approved by the competent national committee on 3 June 2021.

2° – Proportion rules on the holding:

The proportion of the variety of interest for adaptation purposes castets N is less than or equal to 5 % of the grape varieties of the holding. The compliance of the grape varieties is assessed over all the parcels of the holding producing the wine of the AOC concerned.

VI. – Management of the vineyard

1° – Training methods:

a) – Planting density.
The vines present a minimum planting density of 7,000 plants per hectare. The spacing between rows is less than or equal to 1.50 metre. Each plant has a maximum area of 1.43 square metre, this area being obtained by multiplying the distance between rows by the distance between plants on the same row.

b) – Pruning rules.
Pruning is carried out at the latest by the spread-leaves stage (Lorenz stage 9). The vines are pruned according to the following techniques with a maximum of twelve free eyes (buds) per plant:

- the so-called “médocaine” cane pruning, or spur-and-cane pruning, the plant bearing two canes of at most four eyes per cane for the varieties cot N, cabernet-sauvignon N, merlot N and petit verdot N, or five eyes at most per cane for the varieties cabernet franc N and carmenère N. The return spurs are pruned to two free eyes;

- spur pruning to two cordons or four-arm fan training.

c) – Trellising rules and foliage height.

- The height of the trellised foliage is at least equal to 0.6 times the spacing between rows for vines whose spacing is less than 1.40 metre.

- The height of the trellised foliage is at least equal to 0.7 times the spacing between rows for vines whose spacing is between 1.40 metre and 1.50 metre inclusive. However, this height may be at least equal to 0.6 times the spacing between rows for vines meeting the specific provisions concerning the limit yield.

- The height of trellised foliage is measured from 0.10 metre below the bending wire up to the upper topping limit.

d) – Average maximum load per parcel.

- The average maximum load per parcel is fixed at 9,500 kilograms per hectare. This load corresponds to a maximum number of:

- fourteen bunches per plant for the petit verdot N variety and for pruning carried out as cordon and fan;

- twelve bunches per plant for the other varieties.

- Where irrigation is authorised in accordance with the provisions of Article D. 645-5 of the Rural and Maritime Fishing Code, the average maximum load per parcel of the irrigated parcels is fixed at 8,000 kilograms per hectare.

e) – Threshold for missing vines.
The percentage of dead or missing vine plants referred to in Article D. 645-4 of the Rural and Maritime Fishing Code is fixed at 20 %.

Dead plants must be removed from the parcels; any storage of these dead plants on the parcels is prohibited.

f) – Cultivation condition of the vine.
The parcels are managed so as to ensure a good overall cultivation condition of the vine, in particular its sanitary condition and the upkeep of its soil.

2° – Other cultivation practices:

Before each new planting, every operator carries out a physico-chemical analysis of the soil of the parcel in order to have all the information necessary to know the viticultural situation and its potential.

Chemical weeding of the headlands is prohibited.

Total chemical weeding of the parcels is prohibited.

On all the inter-rows, the control of the vegetation, sown or spontaneous, is ensured by mechanical or physical means.

Every operator calculates and records its treatment frequency index (IFT).

3° – Irrigation:

Irrigation during the vine's growing period may be authorised in accordance with the provisions of Article D. 645-5 of the Rural and Maritime Fishing Code.

VII. – Harvest, transport and ripeness of the grapes

1° – Harvest:

The wines come from grapes harvested at proper ripeness.

2° – Ripeness of the grapes:

a) – Grapes with a sugar content of less than 189 grams per litre of must for merlot and 180 grams per litre of must for the other varieties may not be considered to be at proper ripeness.

b) – Minimum natural alcoholic strength by volume. The wines present a minimum natural alcoholic strength by volume of 11 %.

VIII. – Yields. – Entry into production

1° – Yield:

The yield referred to in Article D. 645-7 of the Rural and Maritime Fishing Code is fixed at 57 hectolitres per hectare.

2° – Limit yield:

a) – The limit yield referred to in Article D. 645-7 of the Rural and Maritime Fishing Code is fixed at 63 hectolitres per hectare.

b) – For vines whose spacing is between 1.40 metre and 1.50 metre inclusive and whose trellised foliage height is between 0.6 and 0.7 times the spacing between rows, the limit yield is fixed at 60 hectolitres per hectare.

3° – Entry into production of young vines:

The benefit of the controlled designation of origin may be granted to wines coming from:

- parcels of young vines only from the second year following that in the course of which planting was carried out in place before 31 July;

- parcels of young vines only from the first year following that in the course of which grafting in place was carried out before 31 July;

- parcels of vines that have been top-grafted, at the earliest in the first year following that in the course of which the top-grafting was carried out before 31 July, and once the parcels no longer contain any varieties other than those permitted for the designation. By way of derogation, in the year following that in the course of which the top-grafting was carried out before 31 July, the varieties permitted for the designation may represent only 80 % of the grape varieties of each parcel concerned.

IX. – Processing, elaboration, ageing, packaging, storage

1° – General provisions:

The wines are vinified in accordance with local, fair and constant usages.

a) – Blending of the varieties. The proportion of the variety of interest for adaptation purposes castets N is less than or equal to 10 % in the blend of the wine lots intended for marketing.

b) – Malolactic fermentation. Every lot of wine marketed presents a malic acid content less than or equal to 0.30 gram per litre.

c) – Analytical standards.

- Every lot of wine marketed presents a content of fermentable sugars (glucose and fructose) less than or equal to 2 grams per litre.

- Every lot of wine marketed in bulk presents a volatile acidity content less than or equal to 13.26 milliequivalents per litre, i.e. 0.79 gram per litre expressed as acetic acid (0.65 gram per litre expressed as H2SO4) until 31 July of the year following that of the harvest, and less than or equal to 16.33 milliequivalents per litre, i.e. 0.98 gram per litre expressed as acetic acid (0.80 gram per litre expressed as H2SO4) after that date.

d) – Oenological practices and physical treatments.

- Subtractive enrichment techniques (SET) are authorised within the limit of a concentration rate of 15 %.

- After enrichment, the wines do not exceed a total alcoholic strength by volume of 13.5 %.

e) – Vat capacity.

- Every operator has a vinification vat capacity at least equal to 1.5 times the average ten-year claimed production of the holding.

- The vinification capacity available at the time of harvest corresponds to the vinification containers.

f) – Overall upkeep of the cellar and equipment. The cellar (floors and walls) and the vinification equipment present a good general condition of upkeep.

2° – Provisions by type of product:

The wines undergo ageing at least until 1 June of the year following that of the harvest.

3° – Provisions relating to packaging:

a) – Packaging is carried out at the earliest on 1 June of the year following that of the harvest and at the latest on 31 December of the third year following that of the harvest.

b) – For each packaged lot, the operator keeps available for the defence and management body and for the approved control body:

- the information appearing in the register of handling operations referred to in Article D. 645-18 of the Rural and Maritime Fishing Code;

- an analysis carried out before or after packaging.

The analysis reports are kept for a period of six months from the date of packaging.

4° – Provisions relating to storage:

The operator demonstrates a place suitable for the storage of the packaged products. A suitable place for the storage of packaged products means any place sheltered from bad weather (wind, rain) and protected from any contamination.

5° – Provisions relating to placing on the market for the consumer:

At the end of the ageing period, the wines are placed on the market for the consumer from 1 September of the year following that of the harvest.

X. – Link with the geographical area

1° – Information on the geographical area

a) – Description of the natural factors contributing to the link

The geographical area of the "Margaux" designation extends over the left bank of the Gironde estuary on a set of gravelly terraces. It comprises 4 communes of the Gironde department following the merger of the communes of Margaux and Cantenac and constitutes the largest of the "communal" appellations of the Médoc.

This appellation, which sits within the context of a temperate oceanic climate, benefits from climatic factors favourable to the establishment of a great vineyard through the regulating thermal effect generated by the presence of the waters of the Atlantic Ocean and of the Gironde. To this climate are sometimes associated a few rainy autumn depressions which largely explain the vintage effect. The main characteristics are above all associated with the geology typical of this sedimentary basin, with the original geological history of its soils, with the relief and the topography, as well as with the present pedological components of its vine lands.

The soils are characterised for the most part on the Plio-Quaternary and Quaternary fluvial deposits of the Garonne. Arranged in terraces, these deposits appear in the form of hills that today rise in tiers between 6 and 33 m in altitude. The dense hydrographic network contributes to the fragmentation of these knolls and allows the drainage waters to be evacuated.

The Quaternary terraces correspond to two large sedimentary sets:

- the first, commonly called the high terrace, of Villafranchian age, involves a meander-type deposition dynamic. This alluvial level is made up of sandy clay with gravels and small pebbles, interspersed with clays and sands. The size of the pebbles does not exceed 35 mm and earned them the name of "graves dragées". It is found exclusively in the southern part of the commune of Arsac.

- the second, which corresponds to the low and middle terraces, involves a much greater competence of the rivers. These deposits are to be related to the outburst-flood phenomena consecutive to the melting of the glaciers during the different glacial periods. To each of these climatic crises corresponds an alluvial level. The alluvial material is clearly coarser, pebble dimensions greater than 80 mm being frequent.

These two sets are separated by a connecting slope which stretches over the commune of Arsac in a direction subparallel to the present-day Gironde. This slope, locally cut by deep "ravines", is today covered by sandy formations of aeolian and colluvial origin.

To the west of these alluvial sheets, the plateau lying between 30 and 40 m in altitude is covered by an important sandy formation of aeolian origin: the sand of the landes.

To the east, along the Gironde estuary, along a strip of one to two kilometres, are found vast plains of alluvial origin situated at altitudes below 5 m. They constitute what are commonly called the palus, predominantly silty- clayey but sometimes sandier.

The ancient substratum of these fluvial deposits corresponds most often to a formation of continental origin, predominantly clayey, of late Eocene age, or to limestones and marls of upper Eocene age. More rarely, limestones of Oligocene age constitute the foundation of the oldest terrace. This substratum crops out occasionally in the valleys of the tributaries of the Garonne that drain the appellation, as well as at the periphery of the terraces, at the edge of marshes, in the communes of Cantenac, Margaux and Soussans.

The first land registers, which date from the beginning of the 19th century, show that the landscape of the Margaux region was made up of the juxtaposition of viticultural cores mostly situated on the gravelly knolls of the low and middle terraces. The forest was concentrated to the west; meadows and pastures were the preserve of the palus lands.

b) – Description of the human factors contributing to the link

Although the vine appeared as early as the Gallo-Roman period, it was only from the 16th century, under the impulse of great Bordeaux families, that true viticultural properties, the "bourdieux", the ancestors of the wine châteaux, appeared in the Margaux landscape. With the drainage of the lands undertaken under the reign of Louis XIV at the instigation of Dutch engineers, the vineyard rapidly

gained the gravelly knolls of the low and middle terraces, supplanting all other crops. The main crus of Margaux emerged one after another.

Around 1760, almost the whole of the modern vineyard was constituted, and the mapping of the vineyard established at that time (the so-called Belleyme map) differs little from that of today.

These elite cores were little affected by the various viticultural crises that succeeded one another until the middle of the 20th century, whether of sanitary or socio-economic origin. On the other hand, the western limit of the vineyard fluctuated enormously over time according to the economic situation.

Although the use of the name Margaux has been current since at least the 18th century, the designation of origin "Margaux" was the fruit of very numerous lawsuits brought by owners and the viticultural unions. Before the judgments that would define the territorial limits of the Margaux appellation, the names "Margaux" or "near Margaux" were used to designate the wines of the communes of Margaux, Cantenac, Labarde, Arsac and Soussans but also those coming from certain communes not far from the Margaux region.

It was a judgment of the Civil Court of Bordeaux of 3 December 1923 that fixed the first outlines of the future Margaux appellation, by considering that the Margaux region comprises the five communes of Margaux, Cantenac, Soussans, Arsac and Labarde.

The decree of the AOC Margaux of 10 August 1954 recognises the geographical area of the controlled designation of origin Margaux as the five communes of Margaux, Cantenac, Soussans, Arsac and Labarde.

2° – Information on the quality and characteristics of the product

The wines of the controlled designation of origin "Margaux" are exclusively still red wines. They present an intense red colour and an excellent aptitude for cellaring. These wines are of great cellaring potential and are characterised by a certain finesse underlined by fruity aromas.

Cabernet-sauvignon N is the king variety of the Médoc; it occupies nearly 60 % of the vine surfaces of the "Margaux" appellation. It gives the wine its structure, its bouquet and its ageing potential. Merlot N, an essential complementary variety, only rarely represents more than 30 % of the blends. It brings roundness, generosity and complexity of aromas. Cabernet franc N, rarer, brings elegance and subtle spicy aromas. Petit verdot N produces a wine that is quite complete in colour, fruit and tannins.

3° – Causal interactions

The quality and the typicity of the wines of Margaux find their roots in the exceptional complementarity of soils and their topographic situations through their proximity to the estuary, which protects the vineyard from the excesses of the climate.

From the very beginnings of marketing on the London market of the "New French Clarets", at the beginning of the 18th century, the wines of the future château Margaux are named specifically and sell at a price three times higher than that of traditional "claret".

The analysis of the registers of transactions recorded by the broker Abraham Lawton between 1742 and 1775 shows that the five parishes of the future "Margaux" appellation already occupy the front rank, with volumes that represent a little more than a quarter of the total volume of Médoc wines for an amount that slightly exceeds a third of the total market value of the wines of the Médoc.

In 1787, the hierarchy of crus established by Thomas Jefferson places château Margaux among the first. There then appear several crus of the Margaux region such as Durfort, Kirwan, Issan, Marquis de Terme and Rauzan.

The analysis of the fiscal value of the agricultural lands, according to the first land registers established between 1826 and 1830, shows that most of the vineyard was situated on the gravelly knolls of the low and middle terraces, and that it corresponded to the highest taxation rates. These sectors also correspond to the elite cores of the "Margaux" appellation. These elite cores extend over the lands situated on the said terraces, their colluviums and their clayey or calcareous geological

support. For three centuries, usages have consecrated a delimited parcel production area that results from the synthesis of the pedological, topographic, climatic and historical criteria propitious to the establishment of a vineyard of great renown.

The famous 1855 classification, which is largely prefigured by that of Lawton, consecrates the future "Margaux" appellation by endowing it with a unique array of 21 classed growths (grands crus classés) covering the whole range of the classification, with a land base extending over the middle terraces. This recognition would be completed in 1932 by the classification of the crus bourgeois, which would reward 16 properties, with 2 exceptional crus bourgeois, 8 superior crus bourgeois and 6 crus bourgeois.

The permanent concern of the Margaux wine-growers to affirm the unique character of this wine region finds its illustration in the conservation and improvement of ancestral practices and in the selection of the most appropriate parcels and varieties. Because people have been able to express this potential, Margaux is one of the most prestigious vineyards in the world.

XI. – Transitional measures

1° – Delimited area:

The parcels planted with vines excluded from the delimited parcel area, identified by their cadastral references and their areas and the list of which was approved by the competent national committee of the National Institute of Origin and Quality at its session of 16 March 2007, continue to benefit, for their harvest, from the right to the controlled designation of origin until their grubbing-up and at the latest until the 2035 harvest included, subject to meeting the other provisions of the present specification.

The list of the parcels concerned is annexed to the present specification.

2° – Training method:

a) Parcels of vines in place at the date of 31 July 2009 and presenting a planting density between 4,000 plants per hectare and 6,500 plants per hectare continue to benefit, for their harvest, from the right to the controlled designation of origin until grubbing-up and at the latest in 2035, subject to compliance with the trellising and foliage-height rules laid down in the present specification.

b) Parcels of vines in place at the date of 31 July 2009 and presenting a planting density between 6,500 plants per hectare and 7,000 plants per hectare continue to benefit, for their harvest, from the right to the controlled designation of origin until their grubbing-up.

c) The provision relating to the spacing between rows does not apply to vines in place at the date of 31 July 2009.

d) From the 2016 harvest, for parcels of vines in place at the date of 31 July 2009 and not having a minimum trellised foliage height at least equal to 0.7 times the spacing between rows, the limit yield is fixed at 60 hectolitres per hectare.

XII. – Rules of presentation and labelling

The labelling may specify the larger geographical unit "Vin de Bordeaux - Médoc" or "Grand Vin de Bordeaux - Médoc". The dimensions of the characters of this denomination are not greater, both in height and in width, than two thirds of those of the characters composing the name of the controlled designation of origin.

CHAPTER II

I. – Declaration obligations

1° Claim declaration:

The claim declaration is sent to the defence and management body before 15 February of the year following the harvest.

It indicates:

- the designation claimed;

- the volume of the wine;

- the EVV or SIRET number;

- the name and address of the applicant;

- the place of storage of the wine.

It is accompanied by:

- a copy of the harvest declaration and, as the case may be, a copy of the production declaration or an extract of the stock accounts for buyers of grapes and musts;

- and the cellar plan (place of vinification and storage), allowing in particular the number, designation and capacity of the containers to be identified.

2° Prior declaration of removals and packaging:

Operators wishing to make a bulk shipment, a rendu-mise or a partial bottling complete a transaction declaration and transmit it to the approved control body and to the defence and management body within fifteen working days before the scheduled date of the organoleptic examination.

Operators wishing to have the whole of their cellar controlled, with a view to bottling, complete a packaging declaration and lodge it with the approved control body and the defence and management body within fifteen working days before the scheduled date of the organoleptic examination.

3° Declaration relating to the dispatch outside the national territory of a non-packaged wine:

Every operator wishing to carry out a dispatch outside the national territory of a non-packaged wine benefiting from the controlled designation of origin makes the declaration thereof to the approved control body at least 10 working days before the dispatch.

4° Fallback (repli) declaration:

Every operator marketing a wine benefiting from the controlled designation of origin under a more general appellation makes the declaration thereof to the defence and management body and to the approved control body within a maximum period of one month after this fallback.

5° Downgrading declaration:

Every operator carrying out a downgrading of wines benefiting from the controlled designation of origin makes the declaration thereof to the defence and management body and to the approved control body within a maximum period of one month after this downgrading.

II. – Keeping of registers

1° Register of parcels whose trellised foliage height is between 0.6 times and 0.7 times the spacing between rows:

This register is kept available for the approved control body and a copy is attached annually to the claim declaration.

It indicates for each parcel concerned:

- the cadastral reference;

- the area;

- the year of planting;

- the variety;

- the spacings within the row and between rows.

2° Vines under transitional measures

Every operator concerned by the transitional provisions set at XI – 2° of Chapter I keeps available for the officers in charge of the control the inventory of the parcels concerned and, in the event of grubbing-up and replanting, a copy of the declaration of completion of works.

3° Particular documents:

- soil analysis before new planting, to be kept at least until the parcel concerned enters production for the AOC;

- record of maturity controls;

- cellar log containing the analyses before packaging: glucose and fructose, actual alcoholic strength (TAV), total SO2, volatile acidity (VA), malic acid (MA).

- the enrichment log.

CHAPTER III

I – Main points to be checked and evaluation methods

MAIN POINTS TO BE CHECKED	EVALUATION METHODS
A. – STRUCTURAL RULES	
A1. – Belonging of the planted parcels to the delimited area.	Documentary check (using a geographic information system and the up-to-date CVI record) and check in the field.
A2. – Claimable production potential (grape varieties and proportion rules, monitoring of any transitional measures, planting density and trellising, abandoned vines).	Checks carried out: documentary (based on the CVI grape-variety record and the geographic information system data); in the field.
A3. – Processing, ageing, packaging and storage facilities. — Place of vinification.	Documentary check and on-site check.
Minimum vinification capacity.	Documentary check (inventory of containers).
Ageing (duration).	Documentary check and on-site check.
Traceability of packaging.	Documentary check (register keeping) and on-site check.
Storage place suitable for packaged products.	Documentary check and on-site check.
B. – RULES LINKED TO THE PRODUCTION CYCLE	
B1. – Management of the vineyard. — Pruning.	Counting of the number of free eyes (buds) per stock and description of the pruning method.
Trellising rules and foliage height.	Check in the field.
Average maximum load per parcel.	Check in the field in the six weeks preceding the harvest; counting of bunches and estimation of the load.
Cultivation condition of the vine.	Check at the parcel.
B2. – Harvest, transport and ripeness of the grapes. — Ripeness of the grapes.	Verification of the records (information sheet specifying the maturity-monitoring method and the sugar contents) at the operators'; by visual examination of the grapes.
B3. – Processing, elaboration, ageing, packaging, storage. — Oenological practices or treatments (enrichment).	Documentary check and on-site check.
Monitoring of the dates relating to packaging.	Documentary check and on-site check.

B4. – Harvest declaration and claim declaration. — Missing vines.	Documentary check (up-to-date list) and check in the field.
Authorised yield.	Documentary check (check of declarations, yield increase for certain operators [monitoring of the authorisations granted by the INAO services, after enquiry by the said services upon individual request of the operator]).
VSI, volumes harvested in excess of the authorised yield.	Documentary check (monitoring of destruction certificates).
Claim declaration.	Documentary check and on-site check (compliance with the arrangements and deadlines, consistency with the harvest declaration, production declaration, …). Control of the placing into circulation of the products.
C. – CHECKS ON THE PRODUCTS	
Non-packaged wines.	Analytical and organoleptic examination of all the lots.
Packaged wines.	Analytical and organoleptic examination.
Non-packaged wines intended for a dispatch outside the national territory.	Analytical and organoleptic examination of all the lots.

II – References concerning the control structure

National Institute of Origin and Quality (I.N.A.O)
TSA 30003
93555 – MONTREUIL Cedex
Tel: (33) (0)1.73.30.38.00
Email: info@inao.gouv.fr

The control of compliance with the present specification is carried out, on the basis of an approved control plan, by a third-party body offering guarantees of competence, impartiality and independence and having received delegation from the INAO.

ANNEX 1

LIST OF THE PARCELS EXCLUDED FROM THE DELIMITED AREA BENEFITING FROM A PRODUCTION TOLERANCE DEFINED IN CHAPTER I, PART XI-1. — TRANSITIONAL MEASURES RELATING TO THE DELIMITED PARCEL AREA
