SPECIFICATION OF THE CONTROLLED DESIGNATION OF ORIGIN “BANDOL”

approved by the order of 14 April 2025 published in the JORF of 16 April 2025

CHAPTER I

I. – Name of the designation

Only wines meeting the specific provisions set out below may claim the controlled designation of origin “Bandol”, initially recognised by the decree of 11 November 1941.

II. – Geographical denominations and complementary terms

No particular provision.

III. – Colour and types of product

The controlled designation of origin “Bandol” is reserved for still white, red and rosé wines.

IV. – Areas and zones in which the various operations are carried out

1° – Geographical area

All the steps of the production (the harvesting of the grapes, the vinification, the elaboration and the ageing of the wines) take place in the geographical area, within the territory of the following communes of the Var department, on the basis of the official geographic code of the year 2020: Bandol, Le Beausset, La Cadière-d’Azur, Le Castellet, Evenos, Ollioules, Sanary-sur-Mer, Saint-Cyr-sur-Mer.

2° – Delimited parcel area

The wines come exclusively from vines situated within the delimited parcel area as approved by the National Institute of Origin and Quality (INAO) at the sessions of the competent national committee of 26 April 1944, 4 November 1993 and 19 June 2019. The INAO lodges with the town halls of the communes referred to in 1° the graphic documents establishing the parcel boundaries of the production area thus approved.

V. – Grape varieties

1° – Grape varieties

a) The red wines come from the following varieties: - main varieties: cinsaut N, grenache N, mourvèdre N; - accessory varieties: carignan N, syrah N; - varieties of interest for adaptation purposes: Mourvaison N, Counoise N, Xinomavro N, Calabrese N, Agiorgitiko N, subject to the signature of an agreement between the INAO, the ODG and the accredited operators concerned.

b) The rosé wines come from the following varieties: - main varieties: cinsaut N, grenache N, mourvèdre N; - accessory varieties: bourboulenc B, carignan N, clairette B, syrah N, ugni blanc B; - varieties of interest for adaptation purposes: Mourvaison N, Counoise N, Xinomavro N, Calabrese N, Agiorgitiko N, subject to the signature of an agreement between the INAO, the ODG and the accredited operators concerned.

c) The white wines come from the following varieties: - main varieties: bourboulenc B, clairette B, ugni blanc B; - accessory varieties: marsanne B, sauvignon B, semillon B, vermentino B; - varieties of interest for adaptation purposes: Grenache B, Carignan B, Terret B, Assyrtiko B, subject to the signature of an agreement between the INAO, the ODG and the accredited operators concerned.

2° – Proportion rules on the holding

The conformity of the grape varieties is assessed, for the colour considered, over all of the parcels of the holding producing the wine of the controlled designation of origin.

a) – Red wines: - the proportion of the mourvèdre N variety is between 50 % and 95 % of the grape varieties; - the proportion of each of the accessory varieties is less than or equal to 10 % of the grape

varieties; - the proportion of all the varieties of interest for adaptation purposes is less than or equal to 5 % of the grape varieties.

b) – Rosé wines: - the proportion of the mourvèdre N variety is between 20 % and 95 % of the grape varieties; - the proportion of each of the varieties is less than or equal to 10 % of the grape varieties; - the proportion of all the accessory varieties is less than or equal to 20 % of the grape varieties; - the proportion of all the varieties of interest for adaptation purposes is less than or equal to 5 % of the grape varieties of the holding.

c) – White wines: - the proportion of the clairette B variety is between 30 % and 95 % of the grape varieties; - the proportion of each of the accessory varieties marsanne B, sauvignon B, semillon B is less than or equal to 10 % of the grape varieties; - the proportion of the accessory variety vermentino B is less than or equal to 20 % of the grape varieties; - the proportion of all the accessory varieties is less than or equal to 20 % of the grape varieties; - the proportion of all the varieties of interest for adaptation purposes is less than or equal to 5 % of the grape varieties of the holding.

d) – With the exception of the provisions relating to the proportion of the varieties of interest for adaptation purposes, these obligations do not apply to operators producing grapes who do not vinify their production, exploiting less than 1.5 hectares in red varieties and/or white varieties in controlled designation of origin and whose holding respects a proportion of main variety(ies) greater than or equal to 50 % of the grape varieties for the colour considered.

VI. – Management of the vineyard

1° – Training methods

a) – Planting density.

The vines present a minimum planting density of 4,440 plants per hectare. The spacing between rows may not be greater than 2.50 metres and the spacing between plants may not be less than 0.80 m. Each plant has a maximum area of 2.25 square metres. This area is obtained by multiplying the inter-row and plant-spacing distances. For vines arranged on terraces, each plant has a maximum area of 2.25 square metres, the calculation of which is obtained by multiplying the inter-row and plant-spacing distances. The spacing between rows may not be greater than 2.50 metres and the spacing between plants within the same row may not be less than 0.70 metre. They may present a maximum spacing of 2.5 metres between the crest of the bank and the first row of the upper terrace, as well as between the foot of the bank or of the low wall and the first row of the lower terrace.

b) – Pruning rules.

- The vines are pruned by short pruning (goblet or Royat cordon) with a maximum of 8 free eyes (buds) per plant. Each spur bears a maximum of 2 free eyes. - The syrah N and sauvignon B varieties may be pruned by Guyot with a maximum of 8 free eyes per plant. - The vines aged more than 30 years may be pruned with a maximum of 12 free eyes per plant. - Pruning is carried out before 1 May.

c) – Trellising rules and foliage height.

For the vines trained according to the “raised single-plane trellising” mode, the height of the trellised foliage, after topping, must be at least equal to 0.3 times the spacing between rows. The height of trellised foliage is measured between the lower limit of the foliage, established at least 0.30 metre above the ground, and the upper topping limit, established at least 0.20 metre above the upper trellising wire.

d) – Average maximum load per parcel.

The average maximum load per parcel is fixed at 6,500 kilograms per hectare. This provision also applies to the parcels, before their entry into production of controlled-designation-of-origin wine, from the 2nd year following that in the course of which planting was carried out in place before 31 July. When irrigation is authorised, in accordance with the provisions of Article D. 645-5 of the Rural and Maritime Fishing Code, the average maximum load per parcel of the irrigated parcels is fixed at 5,000 kilograms per hectare.

e) – Threshold for missing vines.

The percentage of dead or missing vine plants, referred to in Article D. 645-4 of the Rural and Maritime Fishing Code, is fixed at 20 %.

f) – Cultivation condition of the vine.
The parcels are managed so as to ensure a good overall cultivation condition of the vine, in particular its sanitary condition and the upkeep of its soil.

2° – Other cultivation practices

In order to preserve the characteristics of the soils, and more generally the natural factors that are fundamental elements of the terroir:

a) – The operator avoids the development of diseases, parasites and pests that could alter the viticultural potential of the parcels concerned or of the surrounding parcels. Likewise, the soil is maintained to avoid the development of perennial plants.

b) – The practices of disbudding and de-suckering of the plants are compulsory and carried out before veraison. Moreover, the operations of disbudding and de-suckering of the plants, contributing to the control of the yields, are carried out by exclusively manual or mechanical means. Total chemical weeding of the parcels, banks and ditches is prohibited. Chemical weeding of the headlands is prohibited.

c) – The addition of exogenous soil onto parcels of the delimited parcel area is prohibited. By exogenous soil is meant a soil that does not come from the delimited parcel area of the controlled designation of origin "Bandol". Moreover, only movements of soil from neighbouring parcels are authorised. By "neighbouring parcels" is meant all parcels of the delimited area of the PDO BANDOL, situated within a radius of 1 km, so as to maintain the geo-pedological unity.

d) – Any substantial modification of the morphology of the relief and of the natural pedological sequence of a parcel intended for the production of the controlled designation of origin (levelling, backfilling, digging out…) is prohibited, with the exception of classic deep-ploughing works.

3° – Irrigation

Irrigation during the vegetative period of the vine may be authorised, by derogation in accordance with the provisions of Article D. 645-5 of the Rural and Maritime Fishing Code, only in the event of persistent drought and when the latter disturbs the good physiological development of the vine and the good ripeness of the grape. Any fixed irrigation installation, inside the parcels, is prohibited; by fixed irrigation installation is meant any irrigation installation present on a vine parcel outside the authorised irrigation period. In order to preserve the water resource, irrigation by means of sprinkler irrigation systems is prohibited from 8:00 to 18:00. Ferti-irrigation is prohibited outside the authorised irrigation period.

VII. – Harvest, transport and ripeness of the grapes

1° – Harvest

a) – The wines come from grapes harvested at proper ripeness.

b) – Particular harvest provisions. The wines come from grapes harvested manually.

c) – Particular provisions for the transport of the harvest. The bunches of grapes are transported whole to the place of vinification.

2° – Ripeness of the grapes

a) – Sugar richness of the grapes.
The sugar richness of the grapes meets the following characteristics:

COLOUR OF THE WINES	MINIMUM SUGAR RICHNESS OF THE GRAPES (grams per litre of must)
Red wines	207
White wines	187
Rosé wines	187

b) – Minimum natural alcoholic strength by volume.
The alcoholic strength by volume of the wines meets the following characteristics:

COLOUR OF THE WINES	MINIMUM NATURAL ALCOHOLIC STRENGTH BY VOLUME
Red wines	12 %
White wines	11.5 %
Rosé wines	11.5 %

VIII. – Yields. – Entry into production

1° – Yield

The yield referred to in Article D. 645-7 of the Rural and Maritime Fishing Code is fixed at 40 hectolitres per hectare.

2° – Limit yield

The limit yield referred to in Article D. 645-7 of the Rural and Maritime Fishing Code is fixed at 40 hectolitres per hectare. From the 2nd year following that in the course of which planting was carried out in place before 31 July, and until their entry into production of controlled-designation-of-origin wine, the yield of the young vines is limited to 40 hectolitres per hectare.

3° – Entry into production of young vines

The benefit of the controlled designation of origin may be granted to white and rosé wines coming from parcels of young vines only from the 3rd year following that in the course of which planting was carried out in place before 31 July. Moreover, the benefit of the controlled designation of origin may be granted to white and rosé wines coming from: - parcels of young vines only from the 1st year following that in the course of which grafting in place was carried out before 31 July; - parcels of vines that have been top-grafted, at the earliest in the 1st year following that in the course of which the top-grafting was carried out before 31 July. The benefit of the controlled designation of origin may be granted to red wines coming from parcels of young vines only from the 7th year following that in the course of which planting was carried out in place before 31 July. Moreover, the benefit of the controlled designation of origin may be granted to red wines coming from: - parcels of vines only from the 1st year following that in the course of which grafting in place was carried out before 31 July; - parcels of vines that have been top-grafted, at the earliest in the 1st year following that in the course of which the top-grafting was carried out before 31 July.

IX. – Processing, elaboration, ageing, packaging, storage

1° – General provisions

The wines are vinified in accordance with local, fair and constant usages.

a) – Blending of the varieties.
The wines come from the blending of grapes or of wines in the same proportions as those provided for the grape varieties.

b) – Malolactic fermentation.
At the packaging stage, the red wines present a malic acid content less than or equal to 0.4 gram per litre.

c) – Analytical standards.
The wines present, after fermentation, the following contents of fermentable sugars (glucose and fructose):

COLOUR OF THE WINES	MAXIMUM CONTENT OF FERMENTABLE SUGARS (grams per litre)
White and rosé wines	3
Red wines whose natural alcoholic strength by volume is less than or equal to 14 %	3
Red wines whose natural alcoholic strength by volume is greater than 14 %	4

d) – Oenological practices and physical treatments.
- Any thermal treatment of the harvest involving a temperature greater than 40 °C is prohibited; - the use of wood chips is prohibited; - for the elaboration of the rosé wines, the use of charcoals for oenological use is authorised for the musts and new wines still in fermentation arising from pressing, within the limit of 10 % of the volume of rosé wines elaborated by the vinifier concerned, for the harvest considered and at a maximum dose of 60 grams per hectolitre; - any enrichment operation is prohibited.

e) – Prohibited equipment.
The use of continuous vinifiers, continuous presses, centrifugal destemmers, screw draining tables of less than 750 millimetres in diameter and piston crusher-pumps is prohibited.

f) – Vat capacity.
Every operator has a global vat capacity at least equivalent to the average of the volume vinified over the 2 previous harvests.

g) – Good overall upkeep of the cellar (floors and walls) and equipment (hygiene).
The cellar and the vinification equipment must present a good general condition of upkeep.

h) – Control of the vinification temperatures.
The vinification cellar is equipped with a device sufficient for the control of the temperatures of the vinification vats.

2° – Provisions by type of product

a) – The red wines are the subject of a minimum ageing of 18 months in barrels or in casks (foudres).

b) – The white and rosé wines are the subject of an ageing at least until 1 March of the year following that of the harvest.

3° – Provisions relating to packaging

a) – The containers for volumes less than or equal to 1.5 litre are of glass.

b) – For each packaged lot, the operator keeps available for the approved control body: - the information appearing in the register of handling operations referred to in Article D. 645-18 of the Rural and Maritime Fishing Code; - an analysis carried out before or after packaging. The analysis reports must be kept for a period of 3 months from the date of packaging.

4° – Provisions relating to storage

a) – The operator demonstrates a specific place for the storage of the packaged products.

b) – The temperature of the storage places is controlled.

5° – Provisions relating to the movement of products and to placing on the market for the consumer

a) – Date of placing on the market for the consumer.
- At the end of the ageing period, the red wines are placed on the market for the consumer from 1 May of the 2nd year following that of the harvest; - at the end of the ageing period, the white and rosé wines are placed on the market for the consumer from 1 March of the year following that of the harvest.

X. – Link with the geographical area

1° – Information on the geographical area

a) – Description of the natural factors contributing to the link

The geographical area is delimited over eight communes of the Var department. It lies at the heart of a vast amphitheatre constituted by a set of reliefs due to the erosion and to the tectonic phenomena that affected the sedimentary, carbonate and reef formations thus brought to the surface, an amphitheatre creating a landscape of hillsides, closed to the north and open to the Mediterranean Sea by the gulf of Bandol. This topography induces a particular Mediterranean climate, protected from the Mistral, a cold wind coming from the north and dominant in Provence, and creates situations of hillsides and piedmonts benefiting from an average sunshine of 3,000 hours and an annual rainfall of 650 millimetres. Added to this already

favourable climatic context is the moderating effect of the opening onto the Mediterranean, which comes to temper the summer solar ardour and to maintain a slight night-time humidity, thus creating optimal ripeness conditions for the grapes, in particular for the mourvèdre N variety, permitting both the elaboration of long-keeping red wines that support ageing under wood, and of characteristic rosé wines, but also for the clairette B variety, permitting the elaboration of fine and structured white wines. The most characteristic soils are thin, whitish soils, poor in organic matter, sometimes rich in siliceous elements, always with a high stoniness, well drained, thus ensuring an optimal water circulation. The landscape shaped in particular by the cultivation of the vine and of the olive trees results from the perseverance of generations of farmers who have known, over the centuries, how to optimise the occupation of the hillsides and piedmonts while preserving a protective plant cover on the reliefs. To retain the soil and to clear the ground of stones, they built innumerable dry-stone walls, thus creating the "restanques" characteristic of this landscape.

b) – Description of the human factors contributing to the link

In the 4th century BC, the Phocaeans land on the sheltered shores of what will become their colony of "Terroeis", bringing in their amphorae the civilisation of the vine and of wine. Under the Roman Empire "Terroeis" becomes "Torrentum" (between the communes of Saint-Cyr and Bandol). Many of today's wine estates bear the trace of the ancient Roman "villae", rich in archaeological remains (firing kilns for amphorae, wine presses…) attesting to an organised viticultural activity. From then on, numerous testimonies and writings demonstrate the persistence of the cultivation of the vine and the notoriety of the wines produced, from ordinances regulating the circulation of grapes and wines (1363) to derogations from planting restrictions granted in consideration of the nature of the lands and the quality of the wines produced (1731), by way of an architecture and denominations of lieux-dits (Le Vigneret, la Mourvèdrière…). Notably to be cited is Tolozan, who associates landscape and cultivation of the vine in his treatise of Oenology of Lower Provence in 1827: "The region of the wines of Bandol begins at the foot of the mountains of Cuges and heads straight south to its termination at the Gulf of Bandol, over a length of about twelve kilometres. This valley is formed by a double row of hills that branch off to the west and that enclose the great plain of Saint-Cyr, whose gently sloping bank comes to end on the beach of the gulf of Les Lecques. …The hillsides and even the hills are planted with vines." The author adds, testifying to the unity of the sector: "the species of grape that dominates everywhere and that makes the essence of the wines of Bandol is the mourvèdre, a very dark black grape…". History has retained these wines considered as keeping wines, improving with time, in particular that of the long sea crossings. Indeed, taking advantage of the sheltered bay of Bandol, the circulation of the wines produced within the geographical area was notoriously done by boats that stayed offshore, in the roadstead, and that loaded the barrels of wine marked with the branding iron of the letter "B". In the geography of Provence and of the Comtat Venaissin of the principality of Orange, of the County of Nice, published in 1787 (volume I, page 280), it is written: "The soil of Bandol is very dry and stony. The main production of the terroir is the red wine of the first quality, the most sought-after for the Islands. The port of Bandol would be the safest and most convenient of the Province." A port of embarkation and commercial outlet for the wines of Bandol, the town itself was a city of coopers. A deliberation of the Municipal Council dated 1818 attests that more than 6,000 hectolitres of wine passed through the port of Bandol bound for Italy, northern Europe and America. At the end of the Second Empire, no fewer than 80,000 barrels per year were produced at Bandol for the storage and transport of some 160,000 hectolitres! Thus, beyond the producers themselves, a human community living from and living around the production of the wines is attested. This vineyard did not escape the phylloxera crisis but its history, its notoriety, this strong community permitted a rapid reconquest and the maintenance of the ancient usages of planting on terraces, with an adapted training method and planting density, the maintenance of the usual varieties with the dominance of mourvèdre N, seconded in particular by the grenache N and cinsaut N varieties for the elaboration of the red and rosé wines and the clairette B, bourboulenc B and ugni blanc B varieties for the elaboration of the white wines. This community has thus preserved the history, confirmed its know-how and accentuated the notoriety and the quality of the wines of Bandol, recognised as controlled designation of origin as early as 11 November 1941. The vineyard of Bandol counts in 2009, 1,580 hectares for an average annual production of 50,000 hectolitres, shared between 3 cooperative cellars and 54 estates.

2° – Information on the quality and characteristics of the product

The red wines are ageing wines, produced at a low yield (40 hectolitres per hectare maximum) by vines aged more than 7 years, and that begin their development during 18 months, under wood, most often in cask (foudre). The mourvèdre N variety, which must be present at 50 % minimum in the blend, gives them their characteristics: they are powerful, structured, tannic wines of long conservation. The rosé wines occupy an increasingly important place. Vinified by direct pressing, short maceration or bleeding (saignée), they present a pale eglantine robe. The mourvèdre N variety, compulsorily present (minimum 20 %, often 30 % to 40 %), confers on these wines a specific structure, more tannic than the other Provençal rosé wines, requiring a slightly longer time to blossom, but permitting a longer conservation. The white wines, elaborated mainly from the clairette B variety (30 % minimum), present a light straw-yellow robe with floral aromas. A more confidential production than the two preceding ones, it nevertheless contributes to the image and to the balance of the controlled designation of origin. Besides the elements cited above, it is fitting to cite André JULIEN who, in his "Topography of the Vineyards" of 1866, underlines the qualities of the wines of "Bandol": "Bandol, Le Castellet, Saint-Cyr, Le Beausset produce wines that have a very dark colour and much spirit. They are straight in taste, keep for a long time and acquire quality by travelling by sea. The wines of these vineyards are known under the name of Bandol, and considered as forming the first quality of those that are dispatched." André PELICOT, in 1866 also, defines the production zone, in the "Vigneron Provençal", in these terms: "The localities that produce the wines known as Bandol, from the name of the port of embarkation rather than of the places of production, which are …La Cadière, Le Castellet, Saint-Cyr, Le Beausset, Ollioules… These wines are excellent for transport. The mourvèdre makes the base of these wines, which are full-bodied and of the finest colouration, but harsh at the start."

3° – Causal interactions

The conjunction of a Mediterranean climate with maritime influence, of the topography in the form of a cirque open to the sea and protective from the northern influences (wind and temperature), and of a clayey-calcareous soil with a high stoniness confers on this geographical area an edapho-climatic complex that offers to all of the vineyard of "Bandol" optimal conditions and to the mourvèdre N variety, a late-ripening black variety, its ecological niche of predilection, permitting it to reach an ideal ripeness that guarantees the originality and the balance of the wines. In 1787, this particular link between the natural environment and the characteristics and the quality of the wines produced was already underlined: "The particularly mild and sheltered climate of Bandol and of its immediately neighbouring region, a clayey-calcareous subsoil with a high dose of carbonate of lime, the intense reverberation of the solar rays on the hillsides that the immediate proximity of the sea shelters from the rigour of the winter frosts, by the dose of salt and of hydrometric iodine in suspension in the air of this particularly privileged sky, tend to make, of the wines arising from this terroir, the famous products that the félibres of Provence said to be sunshine in a bottle." (The Geography of Provence and of the Comtat Venaissin, ACHARD M., 1787, cited by J.M. MARCHANDIAU in "Gens et Vins du Bandol" – 1991.) Reflecting the usages, the delimited parcel area classifies "the typical poor lands that have long established the renown of the wines of Bandol" by excluding "the fertile and alluvial soils of the valleys, the too fertile deposited alluvium at the foot of hillsides, the pine woods and wooded zones". This delimitation permits an optimal management of the plant, a control of the vigour and of the production potential reflected in practices of low yields arising from short pruning, and in a management of the planting densities adapted to the "restanques". By keeping the tradition of manual harvesting of the grapes, the winegrowers of "Bandol" contribute to preserving the originality and the characteristics of this vineyard in "restanques". Combining the control of the production, the optimal ripeness conditions and the historical requirements of aptitude for transport, the red wines of "Bandol" possess a structure permitting them a long ageing under wood and thus present a strong aptitude for ageing. The optimal conditions of this vast viticultural amphitheatre having permitted the development of know-how within a community of producers and consumers, it was natural to see this know-how applied to the production and appreciation of the rosé and white wines which, even if they have marked history less than the red wines, benefit from a growing notoriety. The production usages of the red wines, from the mourvèdre N variety arising from vines aged at least 8 years, permit indeed a contribution of this variety to the rosé wines, a contribution that will give them a good part of their identity. This rigour, this technical route imposed for the obtaining of the red wines, are of course applied to the white varieties, which confers on the white wines of "Bandol" a structure and a balance permitting them also a characteristic ageing in Provence. In 2010, the notoriety of Bandol is undeniable over all of the production, the rosé and white wines having now attained the reputation of the red wines. Achieving a good part of its

market beyond the national borders and in export, this controlled designation of origin permits a good valorisation of its production.

XI. – Transitional measures

1° – Training methods

The vine parcels in place before 1 August 2004 and not meeting the provisions relating to the planting density continue to benefit, for their harvest, from the right to the controlled designation of origin until they are grubbed up, subject to compliance with the provisions relating to the foliage height fixed in the present specification.

XII. – Rules of presentation and labelling

1° – General provisions

Wines for which, under the terms of the present specification, the controlled designation of origin "Bandol" is claimed and which are presented under the said appellation may not be declared, after the harvest, offered to the public, dispatched, put up for sale or sold unless, in the harvest declaration, in advertisements, on leaflets, labels, invoices and any containers whatsoever, the aforesaid controlled designation of origin is entered.

2° – Particular provisions

a) – The labelling of the wines benefiting from the controlled designation of origin may specify the name of a smaller geographical unit, subject to it being a registered cadastral lieu-dit and to it appearing on the harvest declaration. The name of the registered cadastral lieu-dit is entered immediately after the name of the holding or of the commercial brand.

b) – The use of the name of the variety is authorised only in the same visual field as all the compulsory entries. The dimensions of the characters of the name of the variety may not be greater, both in height and in width, than those of the characters composing the name of the controlled designation of origin.

CHAPTER II

I. – Declaration obligations

1. Claim declaration

The claim declaration must be sent to the defence and management body before 15 December of the year of harvest. It indicates: - the appellation claimed; - the volume of the wine; - the EVV or SIRET number; - the name and address of the applicant; - the place of storage of the wine. It is accompanied by: - a copy of the harvest declaration and, as the case may be, a copy of the production declaration or an extract of the stock accounts for the buyers of grapes and musts; - the general plan of the places of storage, permitting in particular the number, the designation and the capacity of the containers to be identified.

2. Declaration of renunciation to produce

The harvest declarants must declare to the defence and management body, for each campaign, before 1 June preceding the harvest, the parcels that they renounce to declare under AOC "Bandol". The defence and management body will transmit this information to the approved control body.

3. Transaction and removal declaration

Every operator wishing to market in bulk a wine benefiting from the controlled designation of origin must make to the approved control body a transaction declaration for the lot concerned between the day of the contractualisation of the transaction and at least fifteen days before the removal. The lot is defined as a homogeneous whole arising from one or more containers. This declaration specifies the identity of the buyer of the bulk wine (name/company name, address and SIRET number). Every operator must make a removal declaration to the approved control body within a time limit of two working days after the effective completion of all or part of the removal.

4. Prior declaration of packaging

Every operator wishing to package a wine benefiting from the controlled designation of origin must make to the approved control body a prior declaration of packaging for the lot concerned within a minimum time limit of three working days before the packaging, without this time limit being able to exceed one month. The lot is defined as a homogeneous whole arising from one or more containers. Particular cases: The operators who carry out packagings at least twice a week for more than three months in the year must make to the approved control body a prior declaration of packaging of start of operation for the colour concerned, for a determined period and according to the arrangements fixed in the control or inspection plan. The lot is defined as a homogeneous whole arising from one or more containers.

5. Declaration relating to the dispatch outside the national territory of a non-packaged wine

Every operator wishing to carry out a dispatch outside the national territory of a non-packaged wine benefiting from the controlled designation of origin must make the declaration thereof to the approved control body at least ten working days before the dispatch.

6. Downgrading declaration

Every operator carrying out a downgrading of wines benefiting from the controlled designation of origin must make the declaration thereof to the defence and management body and to the approved control body within a time limit of fifteen days maximum after this downgrading.

7. Reshaping of the parcels

Before any addition of soil, any development or any works liable to modify the profile of the soils or the morphology of the reliefs, with the exception of classic deep-ploughing works, a declaration must be sent by the operator to the defence and management body within a time limit of at least four weeks before the date planned for the start of the envisaged works. The defence and management body transmits, without delay, a copy of this declaration to the services of the National Institute of Origin and Quality.

8. List of the parcels comprising dead or missing plants

Every operator must transmit to the defence and management body the list of the parcels provided for in Article D. 645-4 of the Rural and Maritime Fishing Code, at the latest on 30 April of each campaign.

II. – Keeping of registers

No particular provision.

CHAPTER III

I. – Main points to be checked and evaluation methods

MAIN POINTS TO BE CHECKED	EVALUATION METHODS
A – STRUCTURAL RULES	
A1 – Belonging of the planted parcels to the delimited area. Location of the vinification and ageing cellar within the geographical area.	Documentary (up-to-date CVI record) and visits in the field.
A2 – Claimable production potential (pruning method, density, grape varieties and proportion rules, entry of the vines into production).	Documentary and visits in the field.
A3 – Processing, ageing, packaging and storage facility. — Analytical standards: verify the existence of an oenological monitoring of the wines elaborated (by service provision or by own competences). — Prohibited equipment. — Control of the vinification temperatures.	Documentary and visits in the field.
B – RULES LINKED TO THE PRODUCTION CYCLE	
B1 – Management of the vineyard. — Average maximum load per parcel.	Visual verification; counting of bunches and estimation of the load from an indicative table drawn up for this purpose.
B2 – Harvest, transport and ripeness of the grapes. — Ripeness of the grapes: verification of the sugar richness on arrival at the cellar. — Manual harvest:	—

visual verification. — Transport of the harvest: verification of the register of entry of the grapes or other document; observation of the grape-transport equipment.	
B3 – Processing, elaboration, ageing, packaging, storage. — Minimum natural alcoholic strength by volume: checks at the cellar. — Oenological practices (prohibition of the use of wood chips): documentary verification and on-site visits.	—
B4 – Harvest declaration and claim declaration. — Missing vines: documentary (keeping of register) and visits in the field. — Harvest declaration and yield: documentary. — Claim declaration: documentary.	—
C – CHECKS ON THE PRODUCTS	
Following analytical parameters: alcoholic strength by volume (TAV), volatile acidity (VA), SO2 content, fermentable sugars — wines before or at the stage of placing on the market for the consumer; non-packaged wines intended for a dispatch outside the national territory.	Documentary and/or analytical verification.
Organoleptic characteristics — of the wines before or at the stage of placing on the market for the consumer; of the non-packaged wines intended for a dispatch outside the national territory.	Organoleptic examination.
