SPECIFICATION OF THE PROTECTED DESIGNATION OF ORIGIN "MADIRAN"

approved by the order of 13 November 2023 published in the JORF of 19 November 2023

CHAPTER I

I. – Name of the designation

Only wines meeting the provisions set out below may claim the protected designation of origin "Madiran", initially recognised by the decree of 10 July 1948.

II. – Geographical denominations and complementary terms

No particular provision.

III. – Colour and types of product

The protected designation of origin "Madiran" is reserved for still red wines.

IV. – Areas and zones in which the various operations are carried out

1° – Geographical area

The harvesting of the grapes, the vinification, the elaboration and the ageing of the wines are carried out in the geographical area whose perimeter, at the date of approval of the present specification by the competent national committee, encompasses the territory of the following communes on the basis of the official geographic code of the year 2025:

- Gers department: Communes in whole: Maumusson-Laguian, Viella. Commune in part: Riscle (for the sole territory of the delegated commune of Cannet).

- Hautes-Pyrénées department: Castelnau-Rivière-Basse, Hagedet, Lascazères, Madiran, Saint-Lanne, Soublecause.

- Pyrénées-Atlantiques department: Arricau-Bordes, Arrosès, Aubous, Aurions-Idernes, Aydie, Bétracq, Burosse-Mendousse, Cadillon, Castetpugon, Castillon (canton of Lembeye), Conchez-de-Béarn, Corbère-Abères, Crouseilles, Diusse, Escurès, Gayon, Lasserre, Lembeye, Mascaraàs-Haron, Moncaup, Moncla, Monpezat, Mont-Disse, Portet, Saint-Jean-Poudge, Séméacq-Blachon, Tadousse-Ussau, Vialer.

2° – Delimited parcel area

The wines come exclusively from vines situated within the delimited parcel production area as approved by the National Institute of Origin and Quality at the sessions of the competent national committee of 6 March 1997, 8 and 9 November 2006, 3 May 2017 and 29 and 30 June 2023. The National Institute of Origin and Quality lodges with the town halls of the communes referred to in 1° the graphic documents establishing the parcel boundaries of the production area thus approved.

3° – Immediate proximity area

The immediate proximity area, defined by derogation for the vinification, the elaboration and the ageing of the wines, is made up of the territory of the following communes of the Gers department: Labarthète, Riscle and Saint-Mont.

V. – Grape varieties

1° – Grape varieties

The wines come from the following varieties: - main variety: tannat N; - accessory varieties: cabernet franc N, cabernet-sauvignon N, fer N and manseng noir N.

2° – Proportion rules on the holding

The conformity of the grape varieties is assessed over all of the parcels of the holding producing the wine of the protected designation of origin. - The proportion of the tannat N variety is greater than or equal to 60

% of the grape varieties. This obligation does not apply to operators producing grapes who do not vinify their production, exploiting less than 1.50 hectare in protected designation of origin and whose grape varieties compulsorily comprise the tannat N variety.

VI. – Management of the vineyard

1° – Training methods

a) – Planting density.
The vines present a minimum planting density of 4,000 plants per hectare. These vines may not present a spacing between rows greater than 2.50 metres. These vines may not present a spacing between plants within the same row less than 0.80 metre. These provisions do not apply to the vine parcels planted on terraces. By vine planted on terraces is meant a parcel benefiting from a particular development linked to the existing slope, carried out before the planting of the vine, this development entailing a discontinuity of the usual planting spacing and a non-passage of mechanisation between two successive levels. For the vines planted on terraces, the spacing between plants within the same row may not be less than 0.80 metre.

b) – Pruning rules.
The vines are pruned either by short pruning (Royat cordon) or by single or double Guyot pruning, with a maximum of 15 free eyes (buds) per plant. Whatever the pruning technique, the number of fruit-bearing shoots of the year per plant, after flowering (phenological stage 23 of Lorenz), is less than or equal to: - 10 for the tannat N variety; - 12 for the accessory varieties.

c) – Trellising rules and foliage height.
The vines are compulsorily trained in "raised single-plane trellising". The height of the trellised foliage is at least equal to 0.6 times the spacing between rows. The height of trellised foliage is measured between the lower limit of the foliage, established at least 0.30 metre above the ground, and the upper topping limit, established at least 0.20 metre above the upper trellising wire.

d) – Average maximum load per parcel.
- The average maximum load per parcel is fixed at 10,000 kilograms per hectare. - When irrigation is authorised in accordance with the provisions of Article D. 645-5 of the Rural and Maritime Fishing Code, the average maximum load per parcel of the irrigated parcels is fixed at 9,000 kilograms per hectare.

e) – Threshold for missing vines.
The percentage of dead or missing vine plants, referred to in Article D. 645-4 of the Rural and Maritime Fishing Code, is fixed at 20 %.

f) – Cultivation condition of the vine.
The parcels are managed so as to ensure a good overall cultivation condition of the vine, in particular its sanitary condition and the upkeep of its soil.

2° – Other cultivation practices

In order to preserve the characteristics of the physical and biological environment that constitutes a fundamental element of the terroir: - A plant cover of the headlands is compulsory; - the control of the spontaneous vegetation is carried out either by a soil tillage or by equipment ensuring a precise localisation of the treatment products; - the chemical weeding of the headlands is prohibited; - the total chemical weeding of the parcel is prohibited; - on all the inter-rows, the control of the vegetation, sown or spontaneous, is ensured by mechanical or physical means.

3° – Irrigation

Irrigation may be authorised in accordance with the provisions of Article D. 645-5 of the Rural and Maritime Fishing Code.

VII. – Harvest, transport and ripeness of the grapes

1° – Harvest

a) – The wines come from grapes harvested at proper ripeness. The date of the start of the harvest is fixed according to the provisions of Article D. 645-6 of the Rural and Maritime Fishing Code.

b) – Particular provisions for the transport of the harvest. The use of bins equipped with a paddle pump is prohibited.

2° – Ripeness of the grapes

a) – Sugar richness of the grapes. Grapes presenting a sugar richness lower than 198 grams per litre of must for the tannat N variety, and lower than 189 grams per litre of must for the other varieties, may not be considered as being at proper ripeness.

b) – Minimum natural alcoholic strength by volume. The wines present a minimum natural alcoholic strength by volume of 11.5 %.

VIII. – Yields. – Entry into production

1° – Yield

a) – The yield referred to in Article D. 645-7 of the Rural and Maritime Fishing Code is fixed at 55 hectolitres per hectare.

b) – For the vines planted on terraces before the date of approval of the present specification, the volume able to benefit from the protected designation of origin results from the product between the area equal to the number of plants actually planted on the parcel concerned (N) affected by the area of 4 square metres and the yield of the protected designation of origin (R in hectolitres per hectare), that is to say the formula (N × 4) × (R / 10,000). The area equal to the number of plants actually planted on the parcel concerned affected by the area of 4 square metres per plant may not exceed the cadastral area of the parcel. For the vines planted on terraces after the date of approval of the present specification, the volume able to benefit from the protected designation of origin results from the product between the area equal to the number of plants actually planted on the parcel concerned (N) affected by the area of 3 square metres and the yield of the protected designation of origin (R in hectolitres per hectare), that is to say the formula (N × 3) × (R / 10,000). The area equal to the number of plants actually planted on the parcel concerned affected by the area of 3 square metres per plant may not exceed the cadastral area of the parcel.

2° – Limit yield

The limit yield referred to in Article D. 645-7 of the Rural and Maritime Fishing Code is fixed at 60 hectolitres per hectare.

3° – Entry into production of young vines

The benefit of the protected designation of origin may be granted to wines coming from: - parcels of young vines only from the 2nd year following that in the course of which planting was carried out in place before 31 July; - parcels of young vines only from the 1st year following that in the course of which grafting in place was carried out before 31 July; - parcels of vines that have been top-grafted, at the earliest in the 1st year following that in the course of which the top-grafting was carried out before 31 July, and once the parcels no longer contain any varieties other than those permitted for the appellation. By way of derogation, in the year following that in the course of which the top-grafting was carried out before 31 July, the varieties permitted for the appellation may represent only 80 % of the grape varieties of each parcel concerned.

IX. – Processing, elaboration, ageing, packaging, storage

1° – General provisions

The wines are vinified in accordance with local, fair and constant usages.

a) – Reception and pressing.
The destemming of the harvest is compulsory.

b) – Blending of the varieties.
The tannat N variety represents at least 60 % of the blend of the wines.

c) – Malolactic fermentation.
The malic acid content is less than or equal to 0.4 gram per litre on the lots of wines ready to be marketed in bulk or packaged.

d) – Analytical standards.
Every lot of wine marketed in bulk or packaged presents a content of fermentable sugars (glucose + fructose): - less than or equal to 3 grams per litre for the wines whose natural alcoholic strength by volume is less than or equal to 14 %; - less than or equal to 4 grams per litre for the wines whose natural alcoholic strength by volume is greater than 14 %. Every lot of wine marketed in bulk or packaged presents a modified colouring intensity (OD 420 nm + OD 520 nm + OD 620 nm by spectrophotometry) greater than or equal to 12 at the end of the ageing period provided for in 2° below. The wines present a colouring intensity (Abs 420 nm + Abs 520 nm by spectrophotometry) greater than or equal to 6.

e) – Oenological practices and physical treatments.
- The subtractive enrichment techniques (SET) are authorised within the limit of a concentration rate of 10 %. - The wines do not exceed, after enrichment, a total alcoholic strength by volume of 14 %.

f) – Prohibited equipment.
The use of continuous presses is prohibited.

g) – Vat capacity.
Every operator has a global vat capacity greater than or equal to 1.5 times the product of the yield referred to in 1° of point VIII by the area in production vinified in the cellar.

h) – Overall upkeep of the cellar (floors and walls) and equipment.
- The cellar (floors and walls) and the vinification equipment present a good general condition of upkeep. - The presence of appropriate means of evacuation of the waste waters (evacuation gutters) is compulsory.

2° – Provisions by type of product

After the first racking following the malolactic fermentation, and so that the tannins soften, the wines are the subject of an ageing at least until 15 April of the year following that of the harvest. The ageing is carried out in a container of a volume greater than 100 litres. The ageing may not be carried out in glass containers.

3° – Provisions relating to packaging

For each packaged lot, the operator keeps available for the approved control body: - the information appearing in the register of handling operations referred to in Article D. 645-18 of the Rural and Maritime Fishing Code; - an analysis carried out before or after packaging. The analysis reports are kept for a period of 24 months from the date of packaging.

4° – Provisions relating to storage

The operator demonstrates a specific place, suited to the wine activity, for the storage of the packaged products.

5° – Provisions relating to the movement of products and to placing on the market for the consumer

At the end of the ageing period, the wines are placed on the market for the consumer from 1 May of the year following that of the harvest.

X. – Link with the geographical area

1° – Information on the geographical area

a) – Description of the natural factors contributing to the link

The geographical area is situated to the south and to the west of the Adour, on the southern piedmont of the Pyrenees. It extends over a sector of hillsides belonging to 5 large parallel crests, globally oriented north-south. It is bounded to the east by the alluvial valley of the Adour and to the west by a large homogeneous silty plateau. Further to the north, the "échines" (ridges) continue as far as the Adour but lose in amplitude. To the south, the cold and silty plateaus gain in amplitude and the altitude increases. The vine parcels are scattered on the slopes in a mixed-farming-and-stock-rearing system where the cultivation of maize and stock-rearing occupy a preponderant place. The steepest slopes are often wooded. The geographical area thus extends over the territory of 37 communes distributed over three contiguous departments: the Pyrénées-Atlantiques (28 communes), the Hautes-Pyrénées (6 communes) and the Gers (3 communes). A relatively homogeneous, mild and fairly humid climate reigns over the whole of the geographical area. Its oceanic character is characterised by fairly mild winters and cool and humid springs. A slight continental tendency is observed with hot and often dry summers and autumns. At the end of summer and in autumn, the hot and dry south wind, of the "foehn" type, blows on average 1 day out of 3. The "échines" of the Madiran region are essentially constituted of molasse dating from the Tertiary. These are continental deposits arising from the erosion of the Pyrenees, fairly diversified but above all formed of marls and of a few discontinuous limestone beds that appear at the bottom of the hillsides. At the summit of these molasses were deposited clays with gravels, then an alluvial layer with pebbles, today situated in a summit position. These formations underwent erosion throughout the Quaternary, resulting in the creation of the five "échines" separated by dissymmetric valleys characteristic of Gascony. The steeply sloping slopes, oriented towards the west, reveal the molasse with limestone beds. The gentle slopes, oriented towards the east, are covered with aeolian silts, solifluxed and mixed with the underlying deposits. On the plateaus, at the summit of the échines, the pebble layer is also covered with a thick layer of aeolian silts, except on their edges where the pebbles outcrop and then colluviate on the slopes at the edge of the plateaus. The associated soils are of two large types: - clayey-calcareous soils developed on the molasse in the west slopes; and - acidic leached soils (called boulbènes) on the gentle slopes and the plateaus; the boulbènes are often humid and deep, except when they are enriched with gravels or pebbles. The vegetation clearly marks the differences of soils. The pedunculate oaks and the acidic heaths extend widely over the acidic leached soils and over the little-calcareous clayey soils, whereas the pubescent oaks and the dry lawns develop on the calcareous soils, often localised, at the bottom, at the foot of the steep hillsides oriented towards the west.

b) – Description of the human factors contributing to the link

The archives of the Priory of Madiran show that at the beginning of the 13th century, the vine is omnipresent in the area and participates significantly in the local commercial exchanges. From the 15th century, a sustained trade with the Bigorre and the Pyrenees by the valley of the Adour is established. It is attested by numerous contracts, as Francis Brumont indicates: "numerous merchants from the Bigorre and the Béarn assiduously frequent our districts to acquire there the precious beverage of which their cantons were devoid" ("Madiran et Saint-Mont. Histoire et devenir des vignobles", 1999). This trade lasts until the development of the communication routes in the 19th century. The winegrowers exchanged their red wine for wood, then for building stones, which are still visible today in certain large old farms or dwellings of wine merchants. The demand of the mountain people concerns coloured and full-bodied red wines. The notarial registers of the 16th and 17th centuries show that the red vines were cultivated according to a training method close to the current one (planting in rows, density close to 4,000 plants per hectare, high trellising), which is at the time a guarantee of quality. During the 17th century, a new market opens for the red wines of the region of Madiran: they are sold to be transported and consumed in the French Antilles. The Bayonne privateers drank a part of it in passing. Their concentration and their potential for conservation beyond a year make them wines apt to withstand the long maritime transport and the high temperatures on arrival. These two great outlets, the Pyrenees and the Antilles, oriented the production towards coloured, concentrated and tannic wines, with a strong keeping potential. In the 18th century, the varieties used are few: to the Fer N and the Bouchy (Cabernet franc N), established very anciently, was added the Tannat N, a very coloured and tannic variety, which developed in connection with the demand of the markets. In the 18th and 19th centuries, the red wines are sold under the name of "Madiran", a term cited for the first time in 1744, and acquired a great notoriety. The wines of Madiran are notably mentioned in the cargo of the frigate "La Victoire", in April 1757, as Francis Brumont reports in his aforementioned

work. In this sector, the vine then provides the essential part of the income, which distinguishes it from the neighbouring regions. It nevertheless remains one crop among others, in a system of subsistence mixed farming and stock-rearing. The vineyard reached 5,000 ha at the end of the 18th century. The size of the wine estates grows, even if the Madiran region remains a country of small properties where an important part of the land belongs to the peasants. A few notables and small local nobles participate in the development of the trade. The trade develops in the 19th century, and it is this that defines, by its collection zone, the production area of the wines called Madiran. The union of the winegrowers of Madiran is founded in 1906, and the wine union of the Vic-Bilh in 1936. After a first attempt by M. Nabonne, mayor of Madiran, which was not crowned with success, the PDO Madiran is recognised by decree in 1948, with a production area almost identical to that of today: only the commune of Viella is added in 1966. The cooperative cellar of Crouseilles is created in 1950. That of Saint-Mont, created in 1948, also vinifies Madiran. In the 20th century, the vineyard strongly decreased in area under the effect of the cryptogamic diseases, of the two wars, then of the advance of the cultivation of maize. Since the beginning of the 1980s, the vineyard extends regularly and slowly to reach today 1,300 ha, vinified almost in equal share between the private and cooperative cellars.

2° – Information on the characteristics of the product

The wines benefiting from the protected designation of origin "Madiran" are still red wines in which the tannat N variety is very predominantly present. The techniques used for the vinification are guided by the grape varieties: destemming is compulsory. The wines undergo an ageing until 15 April of the year following the harvest. These techniques permit the tannins to soften before marketing. These very coloured and tannic red wines possess a good keeping potential, thanks to their structure. Their aromatic profile, often marked by red and black fruits, gives fresh and fruity wines. It generally evolves towards complex aromas of candied fruits, of spices. The tannins, generally dominant, soften after ageing to arrive at wines of balanced structure. On the palate, these wines combine roundness and richness, but always with a fresh finish.

3° – Causal interactions

The opening, from the 15th century, of markets specific to concentrated and tannic red wines, with a strong keeping potential, oriented the winegrowers in their practice. The Tannat N variety became fundamental in the blends to obtain the product that brought its notoriety to Madiran. This variety is vigorous, fairly late and sensitive to grey rot, but it finds on site climatic conditions that permit it to reach ripeness without difficulty. Indeed, the slopes of the hillsides create favourable topo-climatic conditions by permitting an evacuation of the excess rainwater, and, when they are well oriented, a higher sunshine and higher temperatures, beneficial to the ripening of the harvest. In a region where the great variety of soils and of morphology created a landscape in marquetry, people developed a necessarily discontinuous vineyard, by giving priority to the parcels most apt to bring the grapes to ripeness in good sanitary conditions. The parcel production area delimits this type of parcels (well-oriented slopes on rather free-draining, often stony soils). The producers have acquired a technical mastery in the management and the optimisation of the tannic potential of their varieties: they seek the phenolic ripeness of the grape and adapt the vatting to the quality and to the quantity of the tannins. They blend and age their wines with the concern of conserving their keeping potential and the fruit aromas of the grape. The reputation of the wines of Madiran, structured, tannic and powerful wines, born in the 16th century, endures today. Their notoriety has strongly increased and extended since the beginning of the 20th century, and in particular since the 1980s, thanks to the efforts of the winegrowers, which have resulted in the production of wines with tannins always as present but more melted and of better quality.

XI. – Transitional measures

1° – Delimited parcel area

On a transitional basis, the parcels planted with vine, excluded from the delimited parcel area of the protected designation of origin, identified by their cadastral reference, their area and their grape varieties, and whose list was approved by the competent national committee of the National Institute of Origin and Quality at its session of 6 March 1997, continue to benefit, for their harvest, from the right to the protected designation of origin until they are grubbed up, or at the latest until the 2022 harvest inclusive.

2° – Grape varieties

On a transitional basis, the holdings not having the proportion of the tannat N variety provided for in point V-2 of the present specification continue to benefit, for their harvest, from the right to the protected designation of origin until the bringing into conformity of their grape varieties, or at the latest until the 2022 harvest inclusive.

3° – Training methods

The vine parcels in place at the date of 1 August 1997 and not meeting the provisions relating to the planting density may continue to benefit, for their harvest, from the right to the protected designation of origin until they are grubbed up, subject to the foliage height making it possible to have 1.40 square metres of external surface of plant cover for the production of one kilogram of grapes.

XII. – Rules of presentation and labelling

1° – General provisions

Wines for which, under the terms of the present specification, the protected designation of origin "Madiran" is claimed and which are presented under the said appellation may not be declared after the harvest, offered to the public, dispatched, put up for sale or sold unless, in the harvest declaration, in advertisements, on leaflets, labels, invoices and any containers whatsoever, the aforesaid protected designation of origin is entered.

2° – Particular provisions

a) – The labelling of the wines benefiting from the protected designation of origin may specify the name of a smaller geographical unit, subject to: - it being a registered cadastral lieu-dit; - it appearing on the harvest declaration; - the size of the letters used for the name of the lieu-dit being of a dimension less than or at most equal to that of the letters used for the name of the appellation; - the name of the lieu-dit appearing exclusively in the same visual field as that where the compulsory entries are grouped together, and appearing immediately below or above the name of the appellation.

b) – The labelling of the wines benefiting from the protected designation of origin may specify the larger geographical unit "Sud-Ouest". The dimensions of the characters of the larger geographical unit are not greater, both in height and in width, than those of the characters composing the name of the protected designation of origin.

CHAPTER II

I. – Declaration obligations

1. Prior declaration of parcel allocation

Each operator declares to the defence and management body the list of the parcels allocated to the production of the protected designation of origin before 15 May preceding the harvest. This declaration is renewable by tacit renewal, except for modifications notified by the operator before 15 May preceding each harvest. This declaration specifies: - the identity of the operator; - its EVV or SIRET number; - the cooperative cellar(s) to which it is, where applicable, a supplier; - for each parcel: the cadastral reference, the area, the year of planting, the variety, the planting density, the spacings on the row and between rows. This declaration distinguishes: - the parcels for which the transitional measures relating to the training method apply; - the parcels planted on terraces.

2. Declaration of renunciation to produce

Every operator declares to the defence and management body, before 1 July preceding the harvest, the parcels for which it renounces to produce the protected designation of origin. The defence and management body transmits this declaration to the approved control body as soon as possible.

3. Claim declaration

The claim declaration is sent to the defence and management body before 15 January of the year following that of the harvest. It indicates: - the appellation claimed; - the volume of the wine; - the EVV or SIRET number; - the name and address of the applicant; - the place of storage of the wine. It is accompanied by a copy of the harvest declaration and, as the case may be, a copy of the production declaration or an extract of the stock accounts for the buyers of grapes and musts; and by the general plan of the place of storage of the wines, permitting in particular the number, the designation and the capacity of the containers to be identified according to the arrangements defined in the control plan.

4. Prior declaration of the removals of wines in bulk

Every operator wishing to market in bulk a wine benefiting from the protected designation of origin makes to the defence and management body a removal declaration at least five working days before the operation.

5. Packaging declaration

Every operator packaging a wine of the protected designation of origin makes to the defence and management body a packaging declaration at the latest on the day of the packaging. The operators carrying out more than 12 packagings per year are exempted from this declaration obligation, but send to the defence and management body a declaration of intention of packaging at least eight working days before the first packaging of a lot.

6. Declaration relating to the dispatch outside the national territory of a non-packaged wine

Every operator wishing to carry out a dispatch outside the national territory of a non-packaged wine benefiting from the protected designation of origin makes the declaration thereof to the approved control body at least ten working days before the dispatch.

7. Downgrading declaration

Every operator carrying out a downgrading of wines benefiting from the protected designation of origin makes the declaration thereof to the defence and management body and to the approved control body within a time limit of fifteen days maximum after this downgrading.

II. – Keeping of registers

Every operator must be able to demonstrate the traceability, from the vine to the checked vinification lot. The following registers are filled in regularly and are kept available for the approved control body:

1. Ripeness monitoring

Every operator producing grapes must record the pre-harvest checks carried out on its holding. The ripeness-monitoring register, with the reading of the sugar richness of the grapes per cultivation unit and the reading of the natural alcoholic strength by volume per container, must be filled in and kept available for the approved control body.

2. Vinification register

Every vinifying operator must keep up to date the vinification register per lot, with for each lot: - the total volume of the lot; - the blend of grapes or of wines with the quantity or the volume per variety.

3. General plan of the place of storage

Every vinifying operator must keep up to date the general plan of the place of storage of the wines, permitting in particular the number, the designation and the capacity of the containers to be identified.

CHAPTER III

I. – Main points to be checked and evaluation methods

MAIN POINTS TO BE CHECKED	EVALUATION METHODS
A – STRUCTURAL RULES	

A1 – Belonging of the planted parcels to the delimited area.	Documentary check (up-to-date CVI record) and in the field.
A2 – Claimable production potential: - grape-variety rules; - proportion rules on the holding; - density and inter-row spacing rules; - percentage of dead or missing vine plants; - monitoring of the transitional measures.	Documentary check and check in the field.
A3 – Processing, ageing, packaging and storage facility. — Reception and pressing.	Documentary check and on-site check.
- Place of vinification; - vat capacity; - place of packaging; - place of storage.	Documentary check and on-site check.
Traceability of the packaging.	Documentary check and on-site check.
B – RULES LINKED TO THE PRODUCTION CYCLE	
B1 – Management of the vineyard. — Pruning rules (maximum number of fruit-bearing shoots of the year).	Check in the field; counting of the number of fruit-bearing shoots from the phenological stage known as "flowering".
Average maximum load per parcel.	Estimation of the load from an indicative table drawn up for this purpose.
Other cultivation practices.	Check at the parcel.
Irrigation.	Documentary check and check in the field.
B2 – Harvest, transport and ripeness of the grapes. — Ripeness of the grapes.	Documentary check and check in the field.
Monitoring of the harvest date.	Verification of the derogations, field checks.
B3 – Processing, elaboration, ageing, packaging, storage. — Blends.	Documentary check and on-site check.
Oenological practices or treatments (enrichment, SET).	Documentary check and on-site check.
B4 – Harvest declaration and claim declaration. — Dead or missing plants.	Documentary check (keeping up to date of the list) and check in the field.
Authorised yield.	Documentary check (check of the declarations, monitoring of the authorised derogations, increase of the yield for certain operators [monitoring of the authorisations granted by the INAO services, after enquiry by the said services on individual request of the operator]).
VSI, volumes harvested in excess of the authorised yield.	Documentary check (monitoring of the destruction certificates).
Claim declaration.	Documentary check and on-site visit (compliance with the arrangements and time limits, concordance with the harvest declaration…). Check of the placing into circulation of the products.
C – CHECKS ON THE PRODUCTS	
Non-packaged wines.	Analytical and organoleptic examination at the removal.
Packaged wines.	Analytical and organoleptic examination.
Non-packaged wines intended for a dispatch outside the national territory.	Analytical and organoleptic examination of all the lots.
D – PRESENTATION OF THE PRODUCTS	

Labelling.	Documentary check and on-site check.

II. – References concerning the control structure

National Institute of Origin and Quality (INAO)
TSA 30003
93555 – MONTREUIL-SOUS-BOIS Cedex
Tel: (33) (0)1.73.30.38.00
Fax: (33) (0)1.73.30.38.04
Email: infocontact@inao.gouv.fr

The check of compliance with the present specification is carried out on the basis of an approved control plan and by a third-party body offering the guarantees of competence, impartiality and independence having received delegation from the INAO.

The control plan sets out the self-checks carried out by the operators on their own activity and the internal checks carried out under the responsibility of the defence and management body. It indicates the external checks carried out by the third-party body as well as the analytical and organoleptic examinations. The whole of the checks is carried out by sampling. Non-packaged wines intended for a dispatch outside the national territory are the subject of a systematic analytical and organoleptic check.
